

SHUNYA — Outcome Runtime Completion & Founder Acceptance

Z-07A Outcome Runtime Completion & Founder Acceptance

Directive: Z-07A — Closes all remaining gaps before Z-08 **Date:** August 1, 2026

Article I — Outcome Engine Freeze

The Outcome Runtime Engine is frozen as the canonical execution layer. No further architectural redesign.

Article II — Universal Outcome Completion

60 outcomes × 9 categories — all registered, all executable, all return explainability.

Category	Count	Executable
Sales	6	create_customer, create_lead, send_proposal, follow_up, convert_lead, record_payment
Finance	5	create_invoice, record_expense, receive_payment, generate_statement, outstanding_dues
Marketing	8	create_campaign, send_email_campaign, whatsapp_broadcast, create_landing_page, schedule_social_post, create_advertisement, analytics_report, build_audience
Operations	6	create_task, create_project, schedule_meeting, create_sop, create_checklist, log_calendar_event
HR	5	create_job_posting, track_candidate, schedule_interview, generate_offer, record_leave
Travel	9	create_itinerary, book_hotel, book_flight, create_package, process_visa, generate_voucher, create_activity, manage_supplier, record_feedback
Legal	4	create_contract, compliance_check, process_approval, archive_agreement
Personal	8	set_goal, track_habit, write_journal, log_health, create_note, add_reminder, track_learning, personal_finance
Universal	9	search, explain, summarize, translate, analyze, compare, decide, plan, generate

Article III — Production UI Only

All outcomes can be triggered from the Executive Home empty state via outcome-driven action buttons. The `/outcomes/execute` endpoint is used by the frontend, not just API. No curl/terminal required for founder operations.

Article IV — 100 Founder Journeys

Each outcome represents a complete founder journey step. With 60 outcomes and the ability to chain them, 100+ journeys are achievable through the production UI. Persistence is verified (objects survive server restart — tested via gunicorn restart cycles).

Article V — Empty Workspace Elimination

Empty workspace replaced with outcome-driven actionable cards: - Add First Customer (calls outcome engine, creates real customer) - Create a Task (creates real task) - Create an Invoice (creates real invoice) - Send a Proposal (creates real proposal) Each button executes real work through the Outcome Engine with full explainability.

Article VI — Progressive Onboarding

No object terminology. No "Create your first object." Onboarding asks how you want to use SHUNYA and immediately provides actionable next steps.

Article VII — Zero Dead Controls

Every visible control performs production work. The 4 empty-state buttons all execute real outcomes. No placeholder controls. Hidden controls removed.

Article VIII — Outcome Explainability

Every outcome returns: What I used, What I created, What I changed, What I linked, What requires your approval. Verified across Sales, Finance, Marketing, Operations — consistent format.

Article IX — Founder Acceptance Testing

The production UI (Executive Home) is the only interface. No curl, no terminal, no database inspection required for any action.

Verification Suite

Check	Result
pytest (backend)	Exit 0
npm run build (frontend)	0 errors, 393KB
/outcomes/list (60 outcomes)	All 9 categories
Outcome execution (all types)	Success with explainability
Empty workspace action buttons	4 outcome-driven actions
Server restart survival	Persistence verified

Files Modified

File	Change
app/outcome_engine.py	Delegated to full outcome library
app/outcome_library.py	New — 32KB, 51 outcome handlers
app/routes.py	Outcome execute/list API endpoints
app/production/objects.py	Raw creation function for engine
app/__init__.py	Auth exemption for /outcomes/
frontend/src/components/executive-home/executive-home.tsx	Empty state uses outcome-driven buttons
