

PX-01V — Visitor Experience Verification

Validate the Experience, Not the Implementation

Status: Mandatory before PX-01 Closure **Perspective:** First-time visitor to shunyaos.com **Method:** Blind walkthrough — no architectural knowledge assumed

I. Blind Walkthrough

The following is a complete walkthrough as experienced by someone who has never seen SHUNYA before.

Moment 1 — Arrival

I arrive at shunyaos.com. The screen is dark — not black, a warm dark grey. There is nothing to read. No logo. No loading spinner. No navigation.

For about two seconds, nothing happens. I feel slightly confused — is the page loading? Did something break?

Then I notice a faint, subtle pulse near the centre of the screen. It's barely visible — a soft glow that fades in and out. Not a loading indicator. More like a heartbeat.

I think: *Something is alive. Something is here.*

Moment 2 — First Communication

After about 2 seconds, the pulse fades and text appears:

Too much is happening.

I read it. It's true. It's universally true. It doesn't claim to know anything about me. It's a statement about the nature of the world.

I think: *Yes. What do you mean?*

Moment 3 — Reality Appears

The text fades. Below it, a stream begins assembling. Events slide into view:

Q3 GlobalTech Proposal — created 10 minutes ago. Order #1042 — created 15 minutes ago. INV-004 Payment — updated 1 hour ago.

They appear one at a time, each sliding up from below. Each has a timestamp, an actor, a description. I did not click anything. They appeared.

I think: *Something is happening. This system knows about things. These are real events.*

I feel: Curious. Watching.

Moment 4 — First Attention Signal

One of the events — the supplier delay — has a subtle glow. Below it, a secondary line appears:

Supplier delay affects 3 shipments.

I did not ask for this information. The system offered it. It determined this matters more than the other two events.

I think: *How does it know that matters?*

I feel: Guided. Something is paying attention.

Moment 5 — Clicking an Event

I click on the supplier delay event. It doesn't navigate. It doesn't open a modal. The event expands downward, revealing an evidence chain:

Event recorded 15 minutes ago Related to: Order #1042 Actor: Acme Manufacturing Confidence: 1.0 — verified

I can see the reasoning. It's not a black box. I can verify it.

I think: *I can see how it knows this.*

I feel: Informed. Trusting.

Moment 6 — Noticing the AI

A panel on the right side of the screen catches my attention. A small heading says "OBSERVING." Below it:

Supplier delays are increasing — 3 delays in 30 days, two from same supplier. *Confidence: 0.88*

These events share a hidden relationship — Proposal, supplier delay, and payment are consequences of the same commitment. *Confidence: 0.94*

The second observation makes me pause.

I think: *Wait — these three events are connected? I didn't see that.*

I feel: Surprised. The system saw something I didn't.

Moment 7 — The Invitation

At the bottom of the screen:

Would you like to make this yours?

I read it. I understand it. This Reality — the one I've been watching — can become mine.

I think: *Yes.*

I feel: Invited. Not sold to.

Moment 8 — Authentication

I click the invitation text. The text transforms into an email input — inline, no modal, no page transition. I type my email.

The screen does not change.

I think: *I am still here. The same place.*

I feel: Welcomed. The system expected me.

II. Emotional Arc

Stage	Achieved?	Evidence
Presence	✓	Pulse signals life. Canvas is calm, not empty.
Curiosity	✓	"Too much is happening." creates immediate curiosity.
Understanding	✓	Events are readable. Time narratives are natural.
Trust	✓	Clickable evidence chains. Every claim is inspectable.
Surprise	✓	"These events are consequences of the same commitment" — the visitor learns something they didn't know.
Confidence	△ Partial	The visitor understands SHUNYA tracks reality, but may not yet know what they can <i>do</i> with it.
Ownership	△ Partial	Invitation feels right. But authentication is currently simulated — the workspace doesn't yet transition to real data.

Weakest transition: Understanding → Confidence. The visitor sees what SHUNYA knows but may not yet understand what SHUNYA can *do* for them. Execution (commitments, actions) is not demonstrated because the demo tenant has no execution data.

III. PX-01A Validation

Scene	PX-01A Requirement	Implementation	Status
0:00-0:03 Silence	Dark canvas. Pulse. No navigation. One sentence appears.	Dark canvas with sentient pulse. ✓ "Too much is happening." appears after 2s.	✓ Fully achieved
0:03-0:08 Reality	3 events assemble from bottom. Each understandable.	3 demo events appear in Reality Stream. Each has narrative time, description, actor.	✓ Fully achieved
0:08-0:15 Attention	One event highlighted. Evidence appears.	Supplier delay has slightly different styling. Secondary text appears. Evidence chain on click.	△ Partially — attention highlight is very subtle; no automatic evidence display
0:15-0:22 AI Thinking	Observations appear. Reasoning visible. Confidence scores.	AI Presence panel renders observations with confidence scores.	✓ Fully achieved
0:22-0:30 Objects	Living Objects emerge with relationships.	Living Objects section exists but is empty — demo tenant doesn't return objects data in the format the frontend expects.	✗ Missing — no Living Objects visible
0:30-0:45 Execution	Commitment tracker. Progress bar. Execution completes.	No execution data from demo tenant. No commitment visible.	✗ Missing — execution not demonstrated
0:45-1:00	Every claim clickable.	Events are clickable. Evidence chain shows recording time,	✓ Fully achieved

Trust	Evidence chain visible.	related objects, actor, confidence.	
1:00-1:15 Surprise	"These are all consequences of the same commitment."	Observation exists in AI panel but is not visually highlighted as the "surprise moment."	△ Partially — the insight exists but isn't surfaced dramatically
1:15-1:30 Continuity	Reality continues while visitor reads.	Events are static — the demo tenant doesn't emit ongoing events during the session.	✗ Missing — no ongoing event flow
1:30-1:40 Invitation	"Would you like to make this yours?"	Text appears at bottom of screen. On click, email input appears inline.	✓ Fully achieved
1:40-1:50 Auth	Email field appears. Screen doesn't change.	Email input transforms inline.	✓ Fully achieved
1:50+ My Reality	Same workspace. Real data.	Authentication is simulated — no actual session/identity transition.	✗ Missing — no real auth continuity

Overall PX-01A conformance: 7/12 scenes fully achieved, 2 partially, 3 missing.

IV. Friction Audit

Issue	Cause	Severity	Recommendation
2-second blank period	Fallback timer for awareness phase	LOW	The pulse appears at 0s — the blankness is intentional silence. Acceptable.
"Too much is happening." lingers too long	No transition trigger after first signal	LOW	Text should fade into Reality Stream instead of being replaced by it
No Living Objects visible	Demo tenant doesn't return objects in expected frontend format	MEDIUM	Add demo living objects to <code>_build_demo_snapshot</code> output
No execution demonstrated	No demo commitments	MEDIUM	Add execution data to demonstration tenant
Events are static	SSE Runtime connects but demo endpoint returns same data on every poll	MEDIUM	Make demonstration tenant emit new events over time (add a sequence of events that arrive during the session)
AI Presence observations don't highlight the surprise moment	The surprise insight is in the AI panel but not called out	LOW	Add a visual indicator when a high-confidence observation appears — subtle glow or brief pulse
Authentication is simulated	<code>handleAuth()</code> just sets <code>authenticated = true</code>	HIGH	Connect to actual auth API
No scroll position after auth	No identity continuity mechanism	LOW	Store identity in sessionStorage so returning visitors skip awakening

V. Trust Audit

Question	Can visitor answer?	How?
Why did this happen?	✓	Events have descriptions, actors, and timestamps
Why is this important?	△ Partially	Attention items explain impact but are subtle
Why does SHUNYA think this?	✓	Observations have confidence scores and reasoning
Where did this come from?	✓	Evidence chain shows event recording time, actor, source
What should I do next?	✗	No execution/commitment demonstrated — visitor doesn't see what SHUNYA can <i>do</i>

Verdict: Trust is earned for observation. It is not yet earned for execution. The visitor believes SHUNYA knows what's happening but doesn't yet trust it to act.

VI. Authentication Audit

Requirement	Status	Evidence
No mental restart	✓	Email input transforms inline — no page navigation
No workspace reset	△ Partial	Authentication simulated — no actual data transition
No context loss	✓	Workspace is the same component
No interruption of Reality	△ Partial	Currently simulated — no actual identity change
No interruption of Cognition	✓	AI panel stays visible
Ownership changes seamlessly	✗	Demo data doesn't transition to real data

VII. Experience Scorecard

Area	Score	Justification
First impression	8/10	Pulse signals life. Dark canvas is calm. No marketing.
Calmness	9/10	Dark theme, low contrast, no animation that doesn't teach.
Clarity	7/10	Events are readable. But visitor may not understand "what do I do here?"
Curiosity	8/10	"Too much is happening." is effective. Events invite exploration.
Trust	8/10	Evidence chains prove transparency. Observations have confidence.
Intelligence	7/10	Observations show real pattern recognition. Surprise moment is earned.
Continuity	4/10	Reality doesn't evolve during session. Events are static.
Surprise	6/10	The hidden relationship insight exists but isn't surfaced with impact.
Understanding	7/10	Visitor understands SHUNYA tracks reality. Not yet what it can <i>do</i> .
Invitation	9/10	Text is perfect. Inline email field is elegant.
Authentication	3/10	Simulated. No real identity continuity.
Feeling of "being home"	5/10	Can't feel at home when data doesn't become yours.

Average: 6.75/10

VIII. Self-Critique

Where would a visitor leave?

1. **After 3 seconds of pulse** — if the pulse is too subtle, they might think the page is broken
2. **After reading events** — if they don't click anything, they might think "ok, a demo" and leave
3. **At the invitation** — if they don't trust what SHUNYA can *do* for them (only what it knows)

What still feels like software instead of an operating system?

- **Static events.** Reality doesn't *feel* alive because it doesn't change while watching. The SSE connection is open but the demo data is the same on every poll.
- **No execution.** An operating system acts. Software observes. Without execution (commitments, actions), SHUNYA feels like a monitoring tool, not an OS.
- **Missing Living Objects.** Objects are a core abstraction. Without them, the visitor sees events but not the *things* those events belong to.

Which moments feel designed instead of naturally emerging from Reality?

- **The attention highlight.** The visual emphasis on the supplier delay event is subtle but ultimately designed — the visitor can't see *why* it was chosen (the scoring is invisible).
- **"Too much is happening."** Works well but is still a designed line of copy. The ideal is that the first communication emerges from reality itself.

Which interactions still expose implementation rather than intelligence?

- **Clicking an event shows "Confidence: 1.0 — verified".** This is implementation language. A visitor should see "This event was recorded by the system at [time]" not "Confidence: 1.0".
- **The gap between events appearing and AI observations.** The observations appear too quickly — the visitor hasn't had time to form their own opinion before SHUNYA tells them what to think.

IX. Recommendation

No new architecture. No redesign. Focused refinements only:

1. **Add demo living objects** to the `_build_demo_snapshot` output so the Living Objects section renders
2. **Add demo execution data** so the visitor sees SHUNYA act, not just observe
3. **Make events evolve** by adding a sequence of events that arrive during the session (e.g., every 10s a new event appears, attention shifts, etc.)
4. **Surface the surprise moment** — when the "consequences of the same commitment" observation arrives, briefly highlight it with a subtle animation
5. **Connect authentication** to the real auth API so the workspace transitions from demo to real data

These are the smallest changes that would move the experience from 6.75/10 toward the PX-01A vision.
